Description

The application allows philosophers to post a view philosophy conferences. It requires more-standardized information about each conference than the popular website PhilEvents, making it easier for users to find the information they are looking for about each conference.

Features

- Index of all conferences, orderable by different factors (conference date, submission date, submission type, etc.)
- Page for each conference
- Page for adding a conference
- User page for conferences they've saved

Planning - User Stories

On the index page of all conferences, users can directly see the relevant information about each conference: conference date and location, submission date, submission types, submission word restrictions. They can order the page by these different factors, allowing them to find the sort of conference they're looking for more quickly.

Planning - Database

One table to keep information about every conference, one table to keep users' usernames, passwords, and conference they're interested in.

Technology Stack

- Java
- Springboot
- Thymeleaf
- MySQL

Demo

What I Learned

- CSS Bootstrap in greater depth
- Email alerts
- Uploading photos
- User profiles
- Ordering list of conferences by different factors

What's Next

- Allow those who've posted conferences to edit them
- Automatically delete conferences after the conference date
- Share conference information by email
- Integrate Google Maps for conference location
